POWER METER Series

Measure Everything from AC, DC and 3-Phase Power Sources to Standby Power

The optimal power meter lineup for all applications

POWER METER PW3337/PW3336

HIOKI

AC/DC POWER HITESTER 3334

POWER HITESTER 3333

Advancing the Standard for Power Measurement

The best performing instruments for power measurement on production lines, in laboratories, and in research facilities. Hioki delivers the optimal power testing solutions based on use case conditions, practical application, and accuracy.

Three-phase Power Meter

The PW3337 and PW3336 are suitable for a wide variety of connections, such as measuring three-phase circuits and single-phase 2-wire multiple circuits. There is little internal resistance for the current input, and large currents up to 65 A can be measured with great accuracy.

Single-phase Power Meter

 The PW3335 provides highly accurate measurements for everything from standby power to operating power.
 Compliant with the IEC62301 measurement standard for standby power, it is capable of measuring current as low as 10 µA.
 Designed for power consumption testing, the 3334 and 3333 are guaranteed for accuracy for up to 3 years.

Basic Accuracy and Frequency Bands

Effective Measurement Range

Comparison Chart

4

POWER METER PW3337/PW3336

Accurate measurement of power for three-phase equipment, through direct input up to 1000 V AC/DC / 65 A.

POWER METER PW3335

Highly accurate AC/DC measurements from standby power to operating power

PW3335-04 Front Panel

Half-rack Size to Save Space

For development/production lines for electrical equipment

- Voltage/current/power basic accuracy ±0.1% *
- Highly accurate AC/DC measurements from standby power to operating power
- \bullet Accuracy guaranteed throughout a wide range, from 10 μA to 30 A and 60 mV to 1000 V AC/DC
- Harmonic measurement as standard feature, IEC61000-4-7 compliant
- Compliant with the IEC62301 and EN50564 measurement standards for standby power
- Power factor effect of ±0.1% f.s. delivers highly accurate measurements even for no-load testing of transformers with a low power factor
- Accurate measurement of fluctuating electric power thanks to auto range integration with guaranteed accuracy for measurements while range switching
- Measure up to 5000 A AC with optional current sensor (PW3335-03, -04)

AC/DC POWER HITESTER 3334

Measurement of power consumption and integrated power for battery-operated equipment, home appliances, and office equipment

- Accuracy guaranteed up to 3 years
- Compliant with the SPECpower®
 server power evaluation test

POWER HITESTER 3333

Low-price model for measurement of power consumption on production/inspection lines

• Compact model for saving space, even when added to a system

Units: mm

• Accuracy guaranteed up to 3 years

Dimensional Drawings

Applications

Inspection of Electrical Equipment Production Lines

Best-in-class Accuracy ±0.1% * [PW333 7] [PW333 6] [PW333 5]

Our lineup provides reliable accuracy for a variety of measurement scenarios. Accurately measure the power consumption of a variety of household appliances, such as liquid crystal displays, refrigerators, and air conditioners.

* For complete details, please refer to the specifications

Extensive Interfaces

The built-in interfaces are convenient for transferring data to a PC and equipping the unit on automated machines. PC communication software can be downloaded free of charge from the HIOKI website. For details about the built-in interfaces, refer to the specifications for each model.

Accuracy Guaranteed Up to 3 Years (Longest in the Industry)

The 3333 and 3334 are guaranteed for accuracy for 3 years. Even after 3 years, they maintain an accuracy of $\pm 0.5\%$ rdg. as required for measurements. This 3-year accuracy guarantee, the longest in the industry, helps to save on calibration expenses.

Replacement for Analog Meters 334 333

These models can be used as replacements for analog voltmeters, ammeters, and watt meters. Up to 4 parameters such as voltage, current, and power can be displayed at the same time, allowing 3 measuring devices to be covered with a single unit. The digital display avoids issues such as parallax due to viewing angle and zero shift of the indicator.

Standby Power Measurement

Compliant with IEC62301 and EN50564 Standards

The PW3335 is compliant with measurement standards for standby power, as well as other measurement standards including the ErP Directive and Energy Star. Special parameters required by such standards including THD, CF, and MCR can also be checked with this unit.

Requirements for Measurement Instruments for Standby Power Measurem

Standby Fower Measurements (excerpt)				
Requirement	PW3335 Performance			
Power resolution of 1 mW or better	 Minimum resolution of 0.01 mW (in the 300 V/1 mA range) 			
Crest factor 3 support	✓ Crest factor 6 support			
Harmonic component measurement of up to at least 50th order	 Harmonic measurement as standard feature 			
Data acquisition via interface	✔ LAN (standard feature), RS-232C, GP-IB			

THD (Total Harmonic Distortion): Indicates to what extent harmonic components are present in an AC waveform

CF (Crest Factor): Ratio of the peak value to the effective (RMS) value of an AC waveform MCR (Maximum Current Ratio): Current evaluation index, calculated from

the crest factor and power factor

Wide Range of Effective Measurement

The PW3335 has an effective measurement range of 1% to 150%. Due to this wide range of effective measurement, even equipment with large load fluctuations, such as refrigerators, heaters, and pumps, can be measured accurately under all conditions from noload to full operation.

Long-term Measurement of Refrigerator Power

Create Reports with Free Software

Standby power measurement software can be downloaded free of charge from the HIOKI website. Enter the required information to perform standby power measurements according to standards. Use this software to create reports of measurement results and save test data in CSV format.

Support for CF6 (Crest Factor 6)

When an AC adapter or switching power supply operates with no load, the crest factor of the current waveform increases. The PW3335 can measure waveforms that exceed the range of watt meters that support crest factor 3.

In addition, although the power factor is low during no-load operation, the PW3335 is affected very little by power factor and can therefore achieve accurate measurements.

Measurement of Fluctuating Loads and Power Supply Control

Auto Range Integration with Guaranteed Accuracy when Switching Ranges

These models automatically jump to the optimal power range according to current consumption when performing integration measurements. When switching ranges, power is integrated using the B range*, and therefore there is no loss of integration data. Achieve seamless power integration with guaranteed accuracy, even with loads that experience frequent and repeated fluctuations. In addition, since power integration can be performed for individual ranges, you can measure integrated power for the various conditions of devices that experience power fluctuations.

Intermittent Power Supply

PW333 7 PW333 6 PW333 5

Devices that perform intermittent operation and cycle control repeat a cycle of stopped states and operating states. Therefore, with normal power measurement, it is not possible to determine a value for rated power consumption.

Time average active power (current) is a function that allows the measurement of the time average for power (current) that experiences fluctuations.

AC/DC Measurement

.6 5 ...4 7

"**5**]

For equipment that uses rectifiers and control devices, it might not be possible to accurately measure voltage or current without an AC/DC power meter.

- · Half-wave rectified waveforms used for dryers and fans
- · Full-wave rectified waveforms used for AC adapters
- · Cycle control waveforms used for voltage and temperature adjustment heaters
- · DC waveforms with superimposed ripple components

Full-wave Rectified Waveform

Half-wave Rectified Waveform

Cycle Control Waveform

DC Waveform with Superimposed Ripple

Compliant with IEC61000-4-7 Harmonic Measurement Standards

These models are compliant with the IEC61000-4-7 international standard for harmonic measurements. Conduct harmonic analysis up to the 50th order. The upper limit for harmonic analysis can be set from 2nd to 50th, according to the standard used.

IEC61000-4-7 is an international standard for the measurement of harmonic current and harmonic voltage in power supply systems, and the harmonic current emitted from devices. It specifies the performance of standard measurement instruments. Among the series of standards that include specifications for power measurements, it is used as a reference standard for harmonic measurements.

Support for Various Connections

The PW3337 supports not only 3V3A, but also a variety of threephase connections such as 3P4W, 3P3W2M, and 3P3W3M.

Accuracy Guaranteed for Currents Up to 65 A

Because DCCT allows a current with an input resistance of 1 m Ω or less, accuracy is guaranteed up to 65 A. No heat is generated even with the input of large currents, so there is no loss of accuracy due to self heating. Even if the current exceeds 65 A, an optional current sensor allows measurements up to 5000 A.

DCCT current sensor (in the PW3337)

Temperature distribution image at 30 A DC/10-minute input

PW333 7 PW333 6 PW333

Inverter Efficiency Measurement

Wide Frequency Band (DC, 0.1 Hz to 100 kHz)

These models cover not only the fundamental frequency bands for inverters, but also carrier frequency bands, in a wide range that includes DC and frequencies from 0.1 Hz to 100 kHz.

24-channel Power Meter with Synchronous Control for up to 8 Units

Connect 8 units for synchronous measurement of up to 24 channels. The calculation and control timing for PW3337, PW3336, and PW3335 units that are set as secondaries are synchronized with the primary unit. Use this feature to measure the I/O efficiency of power supply devices, compare multiple pieces of equipment, or to perform simultaneous parallel testing of production lines. Use the free PW COMMUNICATOR* software to calculate the efficiency between multiple units and to acquire data simultaneously from multiple units.

* This software can be downloaded from the HIOKI website

Independent Ranges Per Channel for Highly Accurate Measurements

Independent channels allow the selection of the optimal range for each connection. One example is the simultaneous measurement of the primary side (DC) and secondary side (three-phase) of a PCS using a single unit. Selecting the optimal range for each target to be measured enables highly accurate measurements.

Setting Optimal Range According to Target to be Measured

Simultaneous Measurement of Power Data and Harmonics

In addition to standard measurement items such as voltage, current, and power, all items related to harmonics, such as distortion and content percentage, are calculated internally in parallel at the same time. Items such as RMS value, MEAN value, DC components, AC components, and fundamental wave components can all be confirmed simply by switching the display. Even for DC waveforms with superimposed ripple components, the AC/DC components can be measured separately.

In addition, when using PC software, more than 180 measurement items can be acquired at the same time

I/O Efficiency Calculation with a Single Unit

Input and output can be measured independently at the optimal ranges, and the PCS efficiency can be calculated and displayed on a single unit. PCS can be evaluated with a simple system configuration

1000 V Range for Evaluation of Large Power Conditioners

These models support the measurement of large voltages, which is required in order to measure power conditioners for solar power generation. Measure up to 1000 Vrms and 1500 Vpeak.

Aggregation of Output from DC Current Sensors (Up to 4000 A)

SENSOR UNIT CT9557 is a power supply for highly accurate current sensors that have a waveform output function. In addition to using it as a 4-channel power supply, it is also equipped with a sum feature for aggregating the input waveforms into a single waveform to be output.

Aggregating the Output from 4 Sensors into One Unit

Filter that prevents aliasing errors during sampling

Output Function Linked with Recorder

Display Trends with a Data Logger

The level output (analog output) function delivers measured values that are displayed on the power meter with an analog voltage that is updated every 200 ms. Connect the unit to a data logger to check trends through synchronization with data such as temperature and heat flow*.

* Heat flow: Parameter for understanding the heat reception and heat dissipation of an object. Can be measured with a heat flow sensor.

Observe Power for Each Cycle [PW333 7] [PW333 6] [PW333 5]

The PW3337, PW3336, and PW3335 feature built-in, high-speed active power level output. Level is output for power per cycle. When used in combination with a memory hicorder, fluctuations in power can be observed in real time. This feature is also useful for analyzing equipment that uses power, such as monitoring cutting and grinding tools.

* With the PW3335, high-speed level output is also possible for 45 Hz to 66 Hz voltage and current.

Observe Waveforms with a Memory Hicorder

PW333

The waveform output function outputs the voltage/current waveforms captured by a power meter in the form of high-speed analog voltage. Connect to a memory recorder to check behavior when load fluctuates, such as with the inrush current of a motor.

Log Data Measured by a Power Meter Wirelessly on a Hioki Logger(LR8410 Link)

Wirelessly transmit measurement parameters from the Power Meter PW3335 (excluding model -01) to a Wireless Logging Station LR8410 via Bluetooth[®] wireless technology*.

- The PW3335-02 and PW3335-04 can transmit 7 D/A output parameters.
- The PW3335, PW3335-03 can transmit 4 parameters: voltage, current, power and power factor.

This allows you to combine the voltage and temperature data from the Logger with the current and power from the Power Meter in real time.

* Connection requires the serial - Bluetooth[®] wireless technology conversion adapter recommended by Hioki. Please inquire with your Hioki distributor.

Power Factor Effect of 0.1% or Less, Even at Low Power Factors

A no-load loss test is one indicator for evaluating energy conservation for transformers and motors. The PW3337 and PW3336 are affected very little by power factor, at $\pm 0.1\%$ f.s. or less, allowing active power to be measured with a high level of accuracy at low power factors.

> PW3330 Series Power Factor Effect (Typical) With f.s. input for voltage/current range, and a power factor of 0

Support for Crest Factor 6

The crest factor of a current waveform increases during no-load operation. The PW3337, PW3336, and PW3335 support a crest factor 6. Therefore, even if the waveform peak value is large relative to the range, accurate measurements are possible without exceeding the range.

Example of Transformer Current Waveform during No-load Operation

DC Power Measurement for Batteries and Power Supplies

Best-in-class DC Power Accuracy

These models are best for measuring battery power consumption and output from switching power supplies. Make accurate measurements of DC power, which is an important factor in improving efficiency and saving energy.

DC power accuracy

* For complete details, please refer to the specifications

Key features

DC power accuracy ±0.2% rdg.

Power integration function by polarity

Current and Power Integration Function by Polarity

For integrated measurements, recharging power and discharging power are integrated by polarity every 200 ms. The amount of power in the positive direction, the amount of power in the negative direction, and the sum of the amounts of power in the positive and negative direction during the integration period are measured. Accurate measurement of recharging power and discharging power is possible even if there is rapid repetition of battery recharging/discharging.

Options

TYPE 1 Current Sensor (General Current Measurements)

Connect this unit to the current sensor input terminal (BNC) on the PW3337/PW3336/PW3335. It can be used with a direct connection.

All channels	1P2W	$S_{(i)} = U_{(i)} \times I_{(i)}$	$Q(i) = si(i)\sqrt{S(i)^2 - P(i)^2}$
	1P3W	$S_{sum} = S_{(1)} + S_{(2)}$	
Sum	3P3W	$S_{sum} = \frac{\sqrt{3}}{2} (S_{(1)} + S_{(2)})$	$Q_{sum} = Q_{(1)} + Q_{(2)}$
values	3P3W2M 3V3A	$S_{sum} = \frac{\sqrt{3}}{3} (S_{(1)} + S_{(2)} + S_{(3)})$	
	3P3W3M 3P4W	$S_{sum} = S_{(1)} + S_{(2)} + S_{(3)}$	$Q_{sum} = Q_{(1)} + Q_{(2)} + Q_{(3)}$

(i): Measurement channel

Wiring		λ : Power factor	$oldsymbol{\phi}$: Phase angle
All channels	1P2W	$\lambda(i) = SI(i) \left \frac{P(i)}{S(i)} \right $	$\phi_{(i)} = si_{(i)} \cos^{-1}l \lambda_{(i)}l$
Sum values	1P3W 3P3W 3P3W2M 3V3A 3P3W3M 3P4W	$\lambda_{sum} = Si_{sum} \left \frac{P_{um}}{S_{sum}} \right $	$ \begin{array}{l} \label{eq:when Psum \geq 0} \\ \varphi_{sum} = sis_{sum} \cos^{-1} \lambda \; sum \\ (0^{\circ} \; to \; \pm 90^{\circ}) \\ \mbox{When Psum \geq 0} \\ \varphi_{sum} = sis_{sum} \left 180 - \cos^{-1} \lambda \; sum \right \\ (\pm 90^{\circ} \; to \; \pm 180^{\circ}) \\ \end{array} $

(i): Measurement channel ; The polarity symbol sisum is acquired from the Qsum symbol.

Frequency Measurement Specifications

runnoer of medadurement	
channels	
Measurement source	Select from U (VHz) or I (AHz) by channel
Measurement method	Calculated from input waveform period (reciprocal method)
Measurement range	500 Hz/ 200 kHz (linked to zero-cross filter)
Measurement accuracy	±0.1% rdg. ±1 dgt. (0°C to 40°C)
Effective measuring	
range	For sine wave input that is at least 20% of the measurement
	source's measurement range.
	Measurement lower limit frequency setting: 0.1 sec. / 1 sec. / 10 sec.
	0.1000 Hz to 9.9999 Hz, 9.900 Hz to 99.999 Hz, 99.00 Hz to 999.99 Hz,
	9900 kHz to 9 9999 kHz 9 900 kHz to 99 999 kHz 99 00 kHz to 220 00 kHz

Efficiency Measurement Specifications

Measurement method Calculates the efficiency h [%] from the ratio of active power values for channels and wires Wiring modes and calculation equations Calculated based on the AC+DC rectifier active power PW3336 Wiring CH1 CH2 $\begin{array}{l} Calculation \ formulas \\ \eta 1 = 100 \times |P2| \ / \ |P1| \\ \eta 2 = 100 \times |P1| \ / \ |P2| \end{array}$ $1P2W \times 2$ 1P2W 1P2W 1P3W 1P3W 3P3W 3P3W2M 3P3W 3P3W2M PW3337 Wiring CH1 CH2 CH3 $\begin{array}{c} Calculation \ formulas \\ \eta 1 = 100 \times |P3| \ / \ |P1| \\ \eta 2 = 100 \times |P1| \ / \ |P3| \\ \eta 1 = 100 \times |P3| \ / \ |Psum| \end{array}$ $1P2W \times 3$ 1P2W 1P2W 1P2W 1P3W & 1P2W 3P3W & 1P2W 3P3W2M 1P2W 1P2W 1P3W 3P3W 1 3P3W2M 3P3W2M 3V3A 3P3W3M 3P4W η2=100×|Psum| / |P3 3V3A 3P3W3M 3P4W Effective measuring range As per the active power effective measurement range Display range 0.00[%] to 200.00[%]

 Time Average Current / Time Average Active Power Measurement Specifications (T.AV)

 Measurement method
 Calculates the average by dividing the integrated value by the integration time

 Measurement accuracy
 ±(Current or active power measurement accuracy) ±(±0.01%rdg. ±1dgt.)

 Effective measuring range
 As per the current or active power effective measurement range

Functional Specifications

Auto-range (AUTO)	Automatically changes t wiring mode according Range up: The range is incre range or when the Range down:	to the	input when i	nput e	xceed	0		
	The range is decr range. However, t is exceeded at the	he ran	ge is r	not dec				
Averaging (AVG)	Averages the voltage, or reactive power. The power factor and ph Measured values other integrated values, T.AV distortion, and harmon Method : Simple aver Number of averaging	ase an than p (, crest ics are raging	gle are beak v factor avera	e calcul alues, r, ripple iged.	lated fr power e rate,	rom ave r facto total h	eraged r, frequ armor	data. Jency, nic
	Number of averaging iterations	1 (OFF)	2	5	10	25	50	100
	Display update interval	200ms	400ms	1s	2s	5s	10s	20s

Scaling (VT, CT)	Applies user-defined VT and CT ratio settings to measured values. These settings can be configured separately for each wiring mode. VT ratio setting range : OFF (1.0), 0.1 to 1000 (setting: 0000) CT ratio setting range : OFF (1.0), 0.001 to 1000 (setting: 0000)
HOLD (HOLD)	 Stops display updates for all measured values and fixes the display values at that point in time. Measurement data acquired by communications is also fixed at that point in time. Internal calculations (including integration and integration elapsed time) will continue. Analog output and waveform output are not held.
Maximum value/	· Detects maximum and minimum measured values as well as
minimum value hold	maximum and minimum values for the voltage and current waveform peak and holds them on the display.
(MAX/MIN HOLD)	For data with polarity, display of the maximum value and minimum
	value for the data's absolute values is held (so that both positive and negative polarity values are shown). • Internal calculations (including integration and integration elapsed time) will continue.
Zaus Adiustas sat	Analog output and waveform output are not held.
Zero Adjustment (0 ADJ)	Degausses the current input unit DCCT and then zeroes out the current input offset.
Key-lock	Disables key input in the measurement state, except for the SHIFT
(KÉY LOCK) Backup	key and KEY LOCK key. Backs up settings and integration data if the instrument is turned
System Reset	off and if a power outage occurs. Initializes the instrument's settings. Communications-related settings
,	(communications speed, address, and LAN-related settings) are not initialized
ntegration Mea	surement Specifications
Measurement items	Simultaneous integration of the following 6 parameters for each channel
	(total of 18 parameters): Sum of current integrated values (displayed as Ah on panel display) Positive current integrated value (displayed as Ah+ on panel display) Negative current integrated value (displayed as Ah- on panel display) Sum of active power integrated values (displayed as Wh on panel display) Positive active power integrated value (displayed as Wh+ on panel display) Negative active power integrated value (displayed as Wh+ on panel display)
Measurement types	Rectifiers: AC+DC, AC+DC Umn
	Current: Displays the result of integrating current RMS value data (display values) once every display update interval (approx. 200 ms) as an integrated value. Active power:
	Displays the result of integrating active power values by polarity calculated once every cycle for the selected synchronization source as integrated values. Rectifier: DC
	Displays the result of integrating instantaneous data obtained by sampling both current and active power by polarity as integrated values (When the active power contains both AC and DC, the DC component will not be integrated)
Integration time	1 min. to 10000 hr., settable in 1 min. blocks
Integration time accuracy Integration	<u>±100 ppm ±1 dgt. (0°C to 40°C)</u> (Current or active power measurement accuracy) + (±0.01% rdg. ±1 dgt
measurement accuracy	
Effective measuring range Display resolution	Until PEAK OVER U or PEAK OVER I occurs 999999 (6 digits + decimal point)
Functions	Stopping integration based on integration time setting (timer) Displaying the integration elapsed time (displayed as TIME on panel display Additional integration by repeatedly starting/stopping integration Backing up integrated values and the integration elapsed time during power outage Stopping integration when power returns
External control	Stopping/starting integration and resetting integrated values based on external contro
Measuring range	Corresponds to the range set for START integretation
Harmonic Meas Measurement	urement Specifications (built-in function) · Zero-cross simultaneous calculation method (separate windows

PW333		
PW333		

Measurement types	Rectifiers: AC+DC, DC, AC, FND, AC+DC Umn
Effective measuring range	Voltage ±1% to ±150% of the range. However, up to ±1500 V peak value and 1000 V RMS value
	Current ±1% to ±150% of the range
	Active Power $\pm 0\%$ to $\pm 225\%$ of the range. However, valid when the voltage and current fall within the effective measurement range.
Display range	Voltage Up to $\pm 152\%$ of the range. However, zero-suppression when less than $\pm 0.5\%$
	Current Up to ±152% of the range. However, zero-suppression when less than ±0.5% or less than ±9 µA
	Active Power ±0% to ±231.04% of the range (no zero-suppression)
Polarity	Voltage/ Current Displayed when using DC rectifier
	Active Power Positive : Power consumption (no polarity display) Negative : generation or regenerated power

	 Measurement data acquired that point in time. 		
	 Measurement data acquired to 		

Maximum value/ minimum value hold (MAX/MIN HOLD)	 Detects maximum and minimum measured values (except current integration, active power integration, integration elapsed time, time average current, and time average active power values) as well as maximum and minimum values for the voltage waveform peak and current waveform peak and holds them on the display. For data with polarity, display of the maximum value and minimum value for the data's absolute values is held (so that both positive and negative polarity values are shown). However, this does not apply to the voltage waveform peak value or the current waveform peak value. Internal calculations (including integration and integration elapsed time) will continue. The maximum and minimum values during integration are detected (maximum/minimum value measurement during the integration interval). Analog output and waveform output are not held.
Zero Adjustment	Zeroes out the voltage and current input offset.
Key-lock	Disables key input in the measurement state, except for the KEY LOCK key.
Backup	Backs up settings and integration data if the instrument is turned off and if a power outage occurs.
System Reset	Initializes the instrument's settings.

Integration Measurement Specifications

Integration Mea	surement Specifications
Integration	Switchable between fixed-range integration and auto-range integration.
operation modes	Fixed-range integration Integration can be performed for all voltage and current ranges. The voltage and current ranges are fixed once integration starts.
	Auto-range integration Integration can be performed for all voltage ranges. The current is set to auto-range operation using ranges from 200 mA to 20 A.
	The integrated value for each range can be displayed by switching the current range (200 mA to 20 A) while integration is stopped.
Measurement items and display	Simultaneous integration of the following 6 parameters: Positive current integrated value (Ah+) Negative current integrated value (Ah-) Sum of current integrated values (Ah) Positive active power integrated value (Wh+)
	Negative active power integrated value (Wh-) Sum of active power integrated values (Wh)
Measurement types	Rectifiers: AC+DC, AC+DC Umn Current:
	Displays the result of integrating current RMS value data (display values) once every display update interval as an integrated value.
	Active power: Displays the result of integrating active power values by polarity calculated once every cycle for the selected synchronization source as integrated values.
	Rectifier: DC Displays the result of integrating instantaneous data obtained by sampling both current and active power by polarity as integrated values (these values are not integrated values for the DC component when active power contains both DC and AC components)
Integration time	1 min. to 10000 hr., settable in 1 min. blocks
Integration time accuracy	±0.01% rdg. ±1 dgt.
Integration measurement accuracy	(Current or active power measurement accuracy) + (±0.01% rdg. ±1 dgt.)
Effective measuring range	Until PEAK OVER U lamp or PEAK OVER I lamp lights up.
Display resolution	999999 (6 digits + decimal point)
Functions	Stopping integration based on integration time setting (timer) Stopping/starting integration and resetting integrated values based on external control Displaying the integration elapsed time
	 (displayed as TIME on panel display) Additional integration by repeatedly starting/stopping integration Backing up integrated values and the integration elapsed time during power outages Stopping integration when power returns
	urement Specifications
Measurement method	Zero-cross simultaneous calculation method Uniform thinning between zero-cross events after processing with a digital antialiasing filter Interpolation calculations (Lagrange interpolation)
	When the synchronization frequency falls within the 45 Hz to 66 Hz range: IEC 61000-4-7:2002 compliant Gaps and overlaps may occur if the measurement frequency is
	not 50 Hz or 60 Hz. When the synchronization frequency falls outside the 45 Hz to 66 Hz range: No gaps or overlap will occur.
Synchronization source	Conforms to synchronization source (SYNC) for the basic measurement specifications.

	 When using the 1 mA/ 2 mA range: Add ±1 µA to 10 Hz to 8 kHz measurement accuracy for current. Add (±1 µA) × (voltage read value) to 10 Hz to 8 kHz measurement accuracy for active power. When using the 200 mA/ 500 mA/ 1 A/ 2 A/ 5 A/ 10 A/ 20 A range: Add ±1 mA to DC measurement accuracy for current. Add (±1 mA) × (voltage read value) to DC measurement accuracy for active power. When using the 1 mA/ 2 mA/ 5 mA/ 10 mA/ 20 mA/ 50 mA/ 100 mA range: Add ±10 µA to DC measurement accuracy for current. Add (±10 µA to DC measurement accuracy for current. Add (±10 µA) × (voltage read value) to DC measurement accuracy for active power. 		

Display Specifications

Display	7-segment LED
Number of display parameters	4 (display area a, b, c, and d)
Display resolution	Other than integrated values: 99999 count (5 digits) Integrated values: 999999 count (6 digits)
Display update rate	200 ms ± 50 ms (approx. 5 updates per sec.) to 20 s (varies with number of averaging iterations setting)

Synchronized control

	The timing of calculations; display updates; data updates;
	integration start, stop, and reset events; display hold operation; key
	lock operation: and zero-adjustment operation for the secondary
	PW3335 series is synchronized with the primary PW3335 series.
	Synchronization with the PW3336 series and PW3337 series is also
	supported.
Terminal	BNC terminal × 1 (non-isolated)
Terminal name	External synchronization terminal (EXT.SYNC)
I/O settings	Off
i, o sottingo	Synchronized control function off (signals input to the external
	synchronization terminal (EXT.SYNC) are ignored)
	In
	The external synchronization terminal (EXT.SYNC) is set to input, and a dedicated synchronization signal can be input (secondary
	Out
	The external synchronization terminal (EXT.SYNC) is set to output, and a dedicated synchronization signal can be output (primary).

 Values for f.s. depend on measurement ranges.
 "F" in the tables refers to the frequency in kHz.
 To obtain the current or active power accuracy, add the current sensor's accuracy to the above current and active power accuracy figures.
 The effective measurement range and frequency characteristics conform to the current sensor's specifications.
 The following input are considered reference values: Values for voltage, current, and active power for which 0.1 Hz ≤ f < 10 Hz.
 Values for voltage and active power in excess of 220 V for which 10 Hz ≤ f < 16 Hz.
 Values for voltage and active power in excess of 750 V for which 30 kHz < f ≤ 100 kHz.
 When using the CT684xA series, add ±2 mV to the CT684xA series accuracy after performing CT684xA series zero adjustment using the 1 A range noted on the panel.

Temperature coefficient	Current, active power: ±0.08%f.s./°C or less (instrument temperature coefficient; f.s. : instrument measurement range) Add current sensor temperature coefficient to above.		
Effect of power factor	Instrument: ±0.15%f.s. or less (45 to 66 Hz with power factor = 0) Internal circuit voltage/current phase difference: ±0.0859° Add the current sensor phase accuracy to the internal circuit voltage/current phase difference noted above.		
Current waveform peak value measurement specifications	$\pm 2.0\%$ at DC or 10 Hz $\leq f \leq$ 1 kHz (f.s.: current peak range) Add the current sensor accuracy to the above.		
Harmonic	External current sensor input instru	ment measurement accuracy only	
measurement	Frequency (f)	Voltage, Current, Active power	
accuracy	DC	±0.4% rdg.±0.2%f.s.	
	10 Hz ≤ f < 30 Hz	±0.4% rdg.±0.2%f.s.	
	30 Hz ≤ f ≤ 400 Hz	±0.3% rdg.±0.1%f.s.	
400 Hz < f ≤ 1 kHz ±0.4% rdg.±0.		±0.4% rdg.±0.2%f.s.	
	1 kHz < f ≤ 5 kHz ±1.0% rdg.±0.5%f 5 kHz < f ≤ 8 kHz		
	 Values for f.s. depend on measurement ranges. To obtain the current or active power accuracy, add the current sensor's accuracy to the above current and active power accuracy figures. When using the CT684xA series, add ±2 mV to the CT684A series accuracy after performing CT684xA series zero adjustment using the 1 A range noted on the panel. 		

D/A Output Specifications

(PW3335-02 an	d PW3335-04)
Number of output	7 channels

channels	
Configuration	16-bit D/A converter (polarity + 15 bits)
Output voltage	The output level, output speed, and waveform output can be selected. Level output 2 Vf.s. or 5 Vf.s., linked to display updates High-speed level output 2 Vf.s. or 5 Vf.s., linked to synchronization interval Waveform output 1 Vf.s., linked to sampling
Output parameters	Output parameters for all channels Available selections vary with the output parameter. Level output/ High-speed level output/ Waveform output Voltage, current, active power Only Level output Apparent power, reactive power, power factor, phase angle, total harmonic voltage distortion, total harmonic current distortion, voltage ripple rate, current ripple rate, voltage crest factor, current crest factor, time average current, time average active power, maximum current ratio Only Level output 5 Vf.s. Frequency, current integration, active power integration The rectifier can be selected. Harmonic-order output is not supported.

Output accuracy	f.s.: Relative to the output voltage rated value for each output
	parameter
	Level output
	(Output parameter measurement accuracy) + (±0.2%f.s.) High-speed level output
	(Output parameter measurement accuracy) + (±0.2%f.s.)
	Waveform output (Output parameter measurement accuracy) + (±1.0%f.s.)
Output frequency	Waveform output, high-speed level output
band	At DC or 10 Hz to 30 kHz, accuracy is as defined above.
Maximum output voltage	Approx. ±12 V DC
Output update	Level output
rate	Same as the data update period.
	AC Updated once every cycle for the input waveform set as the
	synchronization source. However, voltage and current are only
	updated once every cycle for input signals from 45 to 66 Hz.
	Waveform output Approx. 1.43 µs (approx. 700 kHz)
Response time	Level output
	0.6 sec. or less High-speed level output
	2 ms or less
	Waveform output 0.2 ms or less
Temperature	±0.05%f.s./°C or less
coefficient	
Output resistance	Approx. 100 Ω
External control	
Functions	Integration start/stop, integration reset and hold via external control
Input signal level	0 to 5 V (high-speed CMOS level) or shorted [Lo]/ open [Hi]
GP-IB interface	
(PW3335-01 an	
Method	Compliant with IEEE488.1 1987, in reference to IEEE488.2 1987 Interface functions

*Add ±50µA to the accuracy when measuring DC current Add (±50µA x voltage value) to the accuracy when measuring DC active power ** Accuracy not defined for current input exceeding 20A

Input Specifications

10115
2.4 MΩ for voltage, 10 mΩ or better (50/ 60 Hz) for current
300 V, ±425 Vpeak
30 A, ±54.0 Apeak
±300% of each voltage range, Within ±425 Vpeak
±300% of each current range, Within ±54.0 Apeak *1
300 V (DC, 50/ 60 Hz)
cations
Voltage and current: 0.5% to 105% of range
Active power: 0% to 110.25% of range
0.000 to 1.000 (no polarity display)
approx. 5 times per second

Functional Specifications

Integration	No.of displayed digits:	Six digits						
measurement	Current Integration:	From 0.00000mAh, Polarity-independent integration and Sum value						
	Active power Integration:	From 0.00000mWh, Polarity-independent integration and Sum value						
	Integration time:	1 min to 10000 h						
		Measurement accuracy of active power ±1dgt.						
Wave peak		tive and negative waveform of voltage/						
measurement		y: $\pm 1.2\%$ f.s. ("f.s." is 300% of each range)						
Rectification method		rue RMS), DC(simple average display) and AC(True RMS)						
Analog output								
(D/A output)	Parameter output representation: Voltage, Current and Active power (3 simultaneous channels)							
(D/A output)		n Current integration, Active power integration,						
	Apparent power, power							
	Voltage output: ±2 V							
	Output accuracy: $\pm 0.5\%$ f.s. + individual measurement accuracy							
Waveform output	Parameter output representation:							
		Active power (3 simultaneous channels)						
		% f.s. + individual measurement accuracy						
Average function		ied number of samples: 1, 2, 5, 10, 25, 50 or 100						
VT or CT ratio	VT ratios: 1, 2, 4, 10, 20							
VI OF CITALIO	CT ratios: 1, 2, 3, 4, 5, 6,	8, 10, 12, 15, 16, 20, 24, 25, 30, 40, 50, 60, 75, 300, 500, 1000, 2000, 3000, 5000, 10000						
External Interfaces	RS-232C interface: Inc	luded as standard						
	Asynchronous comn	nunication method:						
	full-duplex; Baud	rate: 9600 bps (fixed)						
	GP-IB interface (Model
